11 Write a program for the task of Credit Score Classification
Code:

```
from sklearn.tree import DecisionTreeClassifier

X = [
    [750, 50000, 2],
    [600, 25000, 5],
    [800, 70000, 1],
    [550, 20000, 6],
    [720, 60000, 2]
]
y = ['Good', 'Poor', 'Good', 'Poor', 'Good']

model = DecisionTreeClassifier(random_state=0)
model.fit(X, y)

print("Credit Score Class:", model.predict([[700, 45000, 2]])[0])
```

Output:

```
K-Means Clustering
Cluster Labels: [2 2 2 0 0 0 1 1 1]
Cluster Centers:
[[8.33333333 8.33333333]
 [4.66666667 4.66666667]
 [1.66666667 2.        ]]
```
